

STRANGE TIDAL ACTION IN THE SOUTHERN HEMISPHERE

An interesting phenomenon has been occurring around the world that needs to be addressed. Up until this last week and the arrivals of two hurricanes, one in the Gulf of Mexico and one that ran up the length of Florida I tended to consider the story by meteorologists that the water that disappeared from the coastlines of Uruguay and Brazil could be attributed to weather fronts that previously moved through those areas. However, now I'm not so sure that this was the case. First, let's look at the events that happened in South America and we'll explore further. For some reason, back in August of this year, the ocean along the coast of some South American nations retreated from the coast so far that it could not be seen. People in these areas have never seen such a thing and were perplexed.

Photos of exceptional phenomenon in Uruguay: The sea was withdrawn in Punta del Este

The sea withdrew and the ships remained on the land on the south coast of the country. It can be seen in Punta del Este and in the port of Montevideo. Why does the drain on the coasts occur after the storm? The images.

An important and important downstream of the sea affects the coasts of Uruguay this Friday. The phenomenon occurs just when an orange warning by strong winds rules for Montevideo, Canelones, Maldonado, Rocha and Lavalleja.

In the port of Punta del Este the phenomenon is observed with intensity, as dozens of ships and yachts were stranded in the sand. The same happens in the port of Montevideo, especially in the port of Buceo, where there were boats of artisanal fishermen who also ran aground.

This phenomenon is due to strong winds coming from the north, which makes a withdrawal of water on the southern coasts. Winds are expected to rotate this Saturday around 3 pm, according to El Observador Gastón Jaunsolo, the spokesman for the Navy. The Maldonado Intendance issued a statement in which they reported working in the Playa Mansa area of Punta del Este to remove debris and debris from materials that were exposed as a result of low tides.

According to El Pais, the spokesman for the National Navy, Gastón Jaunsolo, is due to "when the north winds predominate, the effect is produced.

The phenomenon is "natural and habitual "in Uruguay and will be maintained at least "Until morning at noon," because "the (north) wind predictions continue."

"Just as when there are storms with a south wind you can see that the waters raise the level and hit the rambla, when there is a north wind the opposite effect takes place: the waters withdraw a little and they produce these downpipes," he explained.

For last morning noon “is planned a rotation south”, which will make “the level of the waters return to normal level”. Source: (El País? Observer). -

MEANWHILE, ON THE OTHER SIDE OF SOUTH AMERICA:

Now, however odd that might seem to be, what makes things even more hard to understand is that on the other side of South America, along the coast of Chile, they were having high tides with waves that many that caused many to think that they were having a tsunami event.

THE IMAGES THAT HAVE LEFT THE STRONG SWELLS IN THE REGION OF VALPARAISO

As explained by the meteorologist of Noticias are expected “waves of 4.5 meters in height, but to that must be added a meter, 1.5 meters by high tide.”

This Thursday, the frontal system, which has presented rains from the region of Valparaiso to the Biobío, will bring with it its strongest effects: wind gusts and abnormal tides.

As explained meteorologist News, Jaime Leyton, the latest “let waves of 4.5 meters high, but it is necessary to add a meter, 1.5 meters high tide, which will occur around noon.”

“These waves are similar to the last tidal wave that occurred on the coastal edge,” Leyton added, so waves of high destructive energy are expected, as “they are equivalent to two and a half floors of an apartment building.”

In addition, the waves will develop, in the first instance, from the Gulf of Arauco to Constitución during the morning, and then expand to Coquimbo and later affect from the Gulf of Arauco to Arica.

These are the images that have left the swells in the region of Valparaiso: [Source of Article and images: <http://www.ahoranoticias.cl/noticias/nacional/203296-nabila-rifo-presenta-recurso-de-proteccion-contra-candidato-que-utilizo-su-imagen.html>]

While the waters were being pulled out to sea in Eastern South America, the opposite occurred on the West Coast of South America, as illustrated above. However, there were other parts of the world that were affected. At the very same time, there were massive waves that crashed into South Africa. It is not known if other coasts in Africa were affected.

Massive waves cause havoc along SA coast

Abnormally high waves and rough swells off the South African coast wreaked havoc. (Supplied)

Cape Town – Abnormally high waves and rough swells off the South African coast wreaked havoc for several buildings on Thursday afternoon, with some people and animals getting caught up in the flurry. Average wave heights of 8m were recorded in East London around 17:00, while the highest recorded wave was 13.68m, South African Weather Service forecaster Venetia Thakula told News24 on Friday. Alerts for high waves were usually issued for anything over 4m. At the Eastern Beach in East London, two women were enjoying themselves close to the water when the waves flooded over to where they were standing. “They were running when they saw the water. They sustained minor injuries like scratches,” said Warrant Officer Hazel Mqala on Friday.

I highly recommend visiting the sourced page above seeing that it has two videos that show how waves came in unexpectedly and how people reacted to it. Now it's not unusual for there to be high waves at or near Cape Town. This is the part of the world where the Indian Ocean meets the Atlantic Ocean and it is notorious for rough seas. Notice that there are normally alerts given when waves are expected to be 4 meters high, that's twelve feet. However, the heights of the waves during this world event were 8 meters or 24 feet and the article says that the highest wave during the event was 13.68 meters, that's 44.88 feet high. To put that into perspective, if this wave was approaching the average two story American home it would tower over it by an additional four or more feet.

STORMS AND DISAPPEARING WATER?

This last week we watched as Hurricane Irma struck southern Florida and then worked its way up the west coast of the state. We also saw in the news an interesting phenomenon that was shown to us on the news. As the storm approached the Bahama's and South East Florida the ocean disappeared from the coast, just like it had in South America a few weeks before. Meteorologists explained this away by saying that Hurricane Irma was acting like a straw, sucking up the water off the coast like a straw and pulling it into the eye of the hurricane. This has happened before, but with Irma, there is one problem with the explanation. Hurricanes are usually stronger on the right side of the storm, meaning that the part due north part of the storm was the strongest. That side of the storm would have caused a surge, not a sucking up of water. If water were to be sucked up from anywhere, it would have been from the area south of the storm. A good example would be the old-fashioned way of stirring a can of paint. We used to get a flat stick at the paint store and we would stick it into the full can of paint and stir. As the stirring motion began the part of the can farthest away from us would get paint over the rim and into the

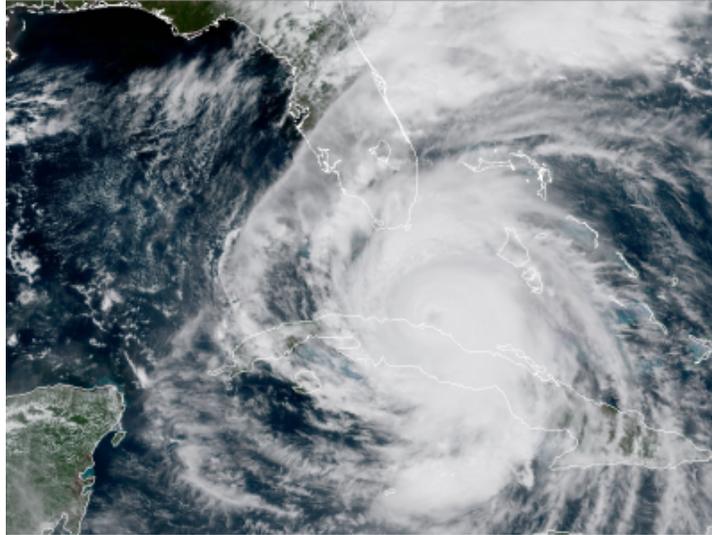

seal groove. We were creating a vortex and every vortex has a stronger point and a weaker point, a point where the paint came from and a point where it flowed higher. Here is a short video of a vortex created by a pump. Notice that if this were an actual hurricane it would be sucking water from behind it, like the pump is doing, not from the top of the vortex. If the vortex in the pump had a larger source of water it would show even more how the water is pulled in from weak areas, not strong areas:

You can also notice how the water is a little higher at the top of the vortex, look at the wall. I know that it is barely discernable, but it is higher. It is also interesting that in the case of a hurricane, it is the right side (or top) from where tornadoes are spawned. Prevailing winds are from west to east in the Northern Hemisphere and when you combine that with the east to west winds of a hurricane it is a perfect condition to cause rotation of clouds in the outer bands of the storm.

What exactly am I saying about this? Well, since the Bahama's and South Florida were in the path of the north (or right) side of the storm it would not be possible for the water to be sucked up into the hurricane. As a matter of fact, they would have and did experience storm water surge. There would have been winds coming from the east south east that would have blown water toward the coast, not away from it.

At the time this was a future path of Hurricane Irma. I followed this path exactly. Notice that The Bahama's and South Florida are on the side of the stronger part of the storm. This would bring higher surf, not disappearing surf.

Actual picture from space of Irma. Again, the Bahama's and South Florida are on the strong side of the storm, the side that would create high tides, not disappearing tides.

What about winds? It is an established fact that the wind can blow water. If you live near any fairly large body of water and you have probably seen the effects of the wind on water. If the wind becomes strong enough it created little waves called Whitecaps. If you read anything about the water disappearing from the beaches in South America you noticed that the news cited meteorologists that claimed that the water's disappearance was caused by strong north winds that came from a storm front that had recently passed. What they failed to mention is that the ocean is a very large place and that water seeks its own level, meaning that any water taken from one area is replaced by water from another area. Had the water disappeared from just one area I could accept their explanation, possibly, but since it was an extensive area that covered southern Brazil and Uruguay, wind does not cut it where an answer is concerned.

The force of the wind would not explain what happened in regard to Hurricane Irma. Remember that the winds on the north (right) side of a hurricane are the strongest so they would have created higher wave action and blown water toward The Bahama's and South Florida. I lived for a while on the coast of New Jersey. When a storm approached from the ocean, or if one was out at sea the surf would rise and the tides would be higher than normal, even if we could not see the storm. So, as for me, using the storm to say that the ocean disappeared from The Bahama's and South Florida just doesn't cut the mustard.

TIDAL FORCES, OR EXTRA TIDAL FORCES?

Here is where I might lose some of you. Tides are affected by many things, but mainly the tidal pull of the sun and moon. Every fisherman knows to pick up a copy of the tide table before they go out to a bay or the coast because they know that the tide affects fishing conditions. When I fished down in the Sacramento Delta with friends, we knew that on an outgoing tide the fish probably would not bite because along with the water going out, so was the food that fish liked, therefore, they would eat the food that passed by them. The best time to fish was when the tide was in and it was ebbing. At this time the fish are hungry again because they've been fighting the tides and currents thus using up the calories that they consumed during the outgoing tide. There is even evidence that tidal action pulls on the crust of the earth, causing it to rise and lower four times a day. There are some scientists that actually try to predict earthquakes looking at the times of extreme high tides, times when the moon is closer to the Earth or when the Earth and Moon are in line with Earth.

Now I have been one of the skeptics when it comes to the whole Nibiru thing and Planet X passing close to earth, but I have to admit that some strange things have been happening with the tides on Earth. When the water went out to sea in South America there were unusually high waves in South Africa. Look at the map below. All three points of contention are on the same latitude, or near the same latitude, Valparaiso on the Coast of Chile had high tides, the ocean disappeared from Southern Brazil and Uruguay and high waves hit Cape Town, South Africa. By the way, the latitude of Cape Town is 33.9249 degrees, Valparaiso, Chile is 33.04225 latitude and the coastal border of Brazil and Uruguay, smack dab in the center of the sea disappearance is 33.69 degrees. It is interesting how the 33 number pops up again.

It's really no secret that the number 33 figures into the occult. I won't go into the significance of that number in this article, but I think that it's important that you [click here](#) to read more about how the number 33 fits into the occult and the NWO's plan on taking over the world. The fact that these events happened at 33 degrees south latitude is suspicious. Just look at 33 degrees north latitude. At that latitude, we have things like the Roswell crash in 1947, many death-row prisons lie on it too. In addition, the line continues to the east to include Tyre in Lebanon, a place that in the Tanakh is associated with Lucifer and his fall. It also includes Mount Hermon, the place where the fallen angels descended before the flood of Noah's Time. moving further east it runs into Babylon, which the Tanakh says is the birthplace of idol worship and the mother of all harlots. Other places of turmoil lie on the 33rd parallel including Beirut and Damascus. For several years now I have been looking for some connection between 33 degrees north and 33 degrees south latitudes, and this tidal event has brought one to light.

Getting back to the events in the southern hemisphere we have to wonder what caused this anomaly. I have not put it past an earthly presence to make such a thing happen. We know that CERN exists and some of us surmise that the Elites are trying to bring the earth to a zero-degree axis rotation. I posted an [article](#) earlier this year about the possibility of there being a second CERN facility directly on the other side of the planet that would act as a counter-balance to ensure that there is not an overcorrection. We believe that the earth was tilted on a 23-degree angle at the time of the flood to lock up the fallen angels from Genesis chapter six and that bringing Earth back to a zero-degree axis spin will unlock that chamber.

Another possibility is that Yahweh is involved directly in moving the planet back into a zero-degree axis spin. It is clear that there will be an opening in the Bottomless Pit and as Yahweh's Word says in the Book of Revelation, the demonic hordes will fly out of it to torment mankind. It is also possible that there will be more than one prison opened and that they will be opened at different times. The very name "bottomless pit" is sort of a misnomer and should be examined. The Greek language renders it better, calling it an abyss. However, a bottomless pit can very easily be understood if one looks at a three-dimensional earth (a sphere, not a flat earth) because if the pit has two entrances because once you hit center you're not going down anymore you're going back up on the other side of the earth, thus it is bottomless. This is why I believe that there is a second CERN because a bottomless pit has to have two openings.

It is no secret that Earth has a wobble. In another article, I presented a video in which Inuit people were interviewed. The Inuit People live in the far north of North America and they hunt sea animals to use for food. They have gone on record that the sun rises upwards of three

days or more earlier than before and that because of this there have been changes in weather patterns and such. Scripture talks about an Earth wobble and/or an axis shift in the Book of Isaiah:

The earth is utterly broken down, the earth is clean dissolved, the earth is moved exceedingly. The earth shall reel to and fro like a drunkard, and shall be removed like a cottage; and the transgression thereof shall be heavy upon it; and it shall fall, and not rise again. Isaiah 24:19-20

Yahweh led me to do a study on the 24th chapter of Isaiah and it has some profound implications. I don't know if you've ever had occasion to watch a drunk person walk and then fall down. There is a process that is involved in such a person's motions. His motion usually starts with a little off-balance motion but as the balance centers in his brain are affected by the alcohol things start to worsen and the wobble becomes much more noticeable and sooner rather than later the wobble becomes so large that he collapses. Yes, the earth has wobbled a tiny bit but Scripture says that Earth is established in its way. Therefore, some sort of effort has to be performed to get it to shift its axis. In my yard, I have planted several trees, pears and apples and some shade trees. When they are saplings, they are easy to topple by the wind, or by our dog who thinks that they are sticks that were planted for her to eat. However, I place a long farm fence post next to a tree and it stabilizes it until the tree has grown strong enough for me to remove the stake. The stake doesn't come out easy because the soil has cemented it into the ground. To remove the stake, I have to move it first front, then back then left and then right until it is loose enough to remove by hand. Since the Earth is set in its way it has to be loosened from where it is held. That is done sometimes by large earthquakes. Science tells us that large earthquakes change the polar axis by a few inches and they slow down the rotation of the earth by milliseconds.

I do think that it is possible that Yahweh might use the influence of a large celestial body passing close by the earth to change the polar axis, perhaps bringing it back to the zero inclination that it once was. That would mean that the sun would be over the equator every day, all year round. If this were allowed to happen and mankind was not as corrupt as mankind is then after a couple hundred years or sooner the earth's temperature would stabilize allowing for the poles to melt and for warmer temperatures to work their way farther north and south all year and every year. Yes, we would still have weather, but probably not as violent as we do in our current era. The only problem with this scenario is that the abyss becomes unlocked and 200 fallen angels along with the spirits of their departed sons will invade the earth causing havoc.

It is very easy for me to blame the disappearing ocean in South America and the crashing waves in Western South America and South Africa on a polar shift. I do believe that it was also the cause for the water to disappear from The Bahama's and Eastern Florida during the time of Hurricane Irma. To explain this action, the Elites used Hurricane Irma but used faulty physics to prove their point and they used storm fronts in South America to explain the water's actions on both coasts. This was done even though each year storms like what we have seen come and go without disappearing water. If you want to conduct an experiment get yourself a large roasting pan and place three bricks in it all in line. The first brick will be South America, the second brick will be Southern Africa and the third brick will be South America again. Tilt the pan a little to the right. The water level on the right side of brick one will be lower, the water at the left side of the second brick will be higher and the water at the left side of the third brick will be higher. Of course, what happened on Earth is a bit different because there are ocean valleys that can absorb some of the water and the force of gravity along with centrifugal force keep the oceans a bit more stable than the roasting pan that you just used. In addition, the ocean currents would move some of the displaced water in the oceans. The fact is that something, probably the tidal action of a large celestial body near the southern hemisphere created very unusual tides, pulling water away from some areas and increasing tides on the other side of ocean basins. It is natural that the Elites would want to hide this event so they blame such events on weather disturbances. If these strange tides were caused by weather manipulation then the Elites would have more reason to hide their actions. The vast majority of people on Earth might be sheeple, but there would be a massive uprising of citizens all over the globe if they realized what mankind, through the help and technology of fallen angels has accomplished.
